FAQs

ABOUT QCE BIOLOGY UNITS 1 & 2

What is BIOZONE's pedagogical approach?	CG3-CG4
Are there support resources for teachers and students?	CG5-CG6
Is there a digital version of QCE Biology?	CG5
Are there model answers?	CG6
Is there a translation feature?	CG5, CG19
How can the Resource Hub save me planning time?	CG6
How do I use the contents and chapter introductions to navigate through the course?	CG7, CG9
How is the book organised?	CG8
Where do I find the learning (unit) objectives?	CG9
What information do the chapter introductions provide?	CG9
How have the activity pages been structured?	CG10
What is the purpose of the QR codes?	CG11
How do I decode and use the tabs?	CG11
How are the syllabus components identified?	CG9, CG11, CG12
Are there assessments?	CG13-CG14
How can I use the resources to plan, deliver, and assess?	CG15
How should I use the resources in my classroom?	CG16-CG18
Is there a glossary?	CG19
How are language skills supported?	CG19
How should I use the science practices chapter?	CG20
What differentiation tools are there?	CG21
Are there practical investigations?	CG22

BIOZONE's Pedagogy

A worktext approach

BIOZONE's delivery method is a departure from a traditional textbook. We combine the very best features of a textbook with the utility of a workbook, producing a **worktext** resource. Importantly, the worktext is owned by the student: it is their own resource to utilise. Whether they are using the print or digital version, students customise their worktext with notes and annotations, check off their progress in the contents pages and chapter introductions, and input their answers on the pages as they work through the activities.

Using a highly graphical approach and short blocks of text, we deliver textbook quality information in an accessible and engaging way, ensuring students are not overwhelmed by large amounts of reading. As students interact with the stimulus material and work through activities, they are encouraged to input their answers directly onto the page. This simple act reinforces the learning moment and forms a **record of work** as they progress through the material. Revision is simplified because the stimulus material, questions, and student answers are in one place.

The material in *QCE Biology* is varied and includes case studies, data analysis, practical investigations, research activities, and assessment tasks. The variety of activity types provides flexibility in the way teachers can assign them. For example, work can be set as homework, completed in class, or set for revision. Teachers can assign students to work on activities individually or set work as a group. The activity based approach simplifies assigning work, and teachers can utilise this to set work for substitute teachers in their absence.

Not all answers need to be graded!

Within the activities, there are plenty of opportunities for students to record answers to the questions in the spaces provided. This approach reinforces the learning moment and allows students to use the resource as a revision tool when they are preparing for assessments. This approach does not mean that teachers are expected to review or grade all student responses. We suggest that only key activities or questions are graded. This might be assessment tasks at the end of each chapter. You may also choose to grade activities with content that students have traditionally found challenging, or where there is often a misunderstanding of the topic. Teachers can also choose to share answers with students. Sharing the model answers via a shared screen allows students to self report grades, an exercise known to be a powerful pedagogical learning tool (Hattie, 2009). Having access to model answers also allows students to refine their initial response if needed. This provides a **powerful second learning moment** to consolidate and extend understanding.

Features to accelerate student learning

Student learning can be influenced by many factors. A synthesis of more than 1,400 meta studies by Hattie (2009) involving over 80,000 individual studies and 300 million students has revealed some of the major influences to student learning. Some factors negatively influence student learning (red, right) while others have positive effects (yellow, green, and blue, right).

BIOZONE's approach incorporates many of the factors shown to positively influence student learning which are underlined in red on the diagram (right). These factors are organically incorporated into our content and enhance the teacher and learner experience.

Hattie, J. (2009). *Visible Learning*. Routledge

BIOZONE's pedagogical approach empowers students to take charge of their learning journey by providing engaging, interactive resources designed to inspire curiosity and foster independent learning skills. Our resources provide a student-centred educational experience. We have purposefully designed the resources to include a number of pedagogical tools proven to enhance learning outcomes for students. Some key pedagogical features are listed below.

Highly graphical delivery of science concepts and short blocks of text.

BIOZONE is committed to providing textbook quality information, but in a way that is engaging and accessible to students. We have deliberately structured activities so they have a highly graphical component. This approach not only engages visual learners and supports varied cognitive learning preferences, but research shows visual aids enhance comprehension and long term memory retention ⁽¹⁾. Incorporating visual elements (photos, illustrations, icons, symbols, figures, and concept maps) into learning materials helps make abstract concepts more tangible, breaking ideas down into digestible and easily understood components.

The use of short blocks of text and generous use of white space ensure students are not overwhelmed by dense information and large blocks of reading material. This encourages both capable and striving learners to interact confidently and regularly with the text components.

Audio visual support through the Resource Hub

Our collection of audio-visual materials (e.g. videos, simulations, models) on the BIOZONE Resource Hub has several purposes:

1. They support delivery of the activity content, providing alternative ways for students to engage with the science concepts being covered.
2. They provide resources for students who like to learn through visualisation or listening.
3. The material provided engages and extends students of all abilities.
4. Audio-visual materials have been shown to have a positive influence on developing critical thinking, problem solving, and analytical skills ⁽²⁾.

Inputting answers aids retention and learning

Our print and digital formats require students to interact directly with the resource. Students engage with the stimulus material then input their answers directly onto the page. The record of work formed from this approach is a powerful pedagogical tool for several reasons:

Firstly, actively inputting answers significantly reinforces student understanding and aids retention of the material. Brain studies show this approach encourages engagement and helps students grasp new concepts ⁽³⁾.

Secondly, forming a record of work simplifies revision because the stimulus material, questions, and the student's own answers are all in one place. This format encourages students to review and test themselves on the material at any time. Research shows that actively self testing (commonly called the testing effect or active recall) has been shown to improve results when compared to simply reading and reviewing material. By regularly recalling information through the testing effect, students strengthen their memory and improve their ability to retrieve information in the future ⁽⁴⁾. This approach allows students to identify gaps in their understanding and begin to address them pro-actively.

Thirdly, students are able to modify their own responses (either because teachers have shared BIOZONE's model answers with students, or the student has gained more understanding independently). Self-marking and answer refinement have been shown to be highly effective strategies for enhancing student achievement ⁽⁵⁾.

Inbuilt pedagogical tools to enhance student learning

John Hattie's meta-analysis studies identify a number of factors which can positively influence student achievement. A summary of some of the most significant factors is provided in the graphic on the previous page ⁽⁵⁾. While some are outside of a teacher's control, many of the most effective tools are supported through the use of BIOZONE's innovative worktext approach and student-driven resources. These are underlined in red on the graphic (previous page).

The Teacher Toolkit

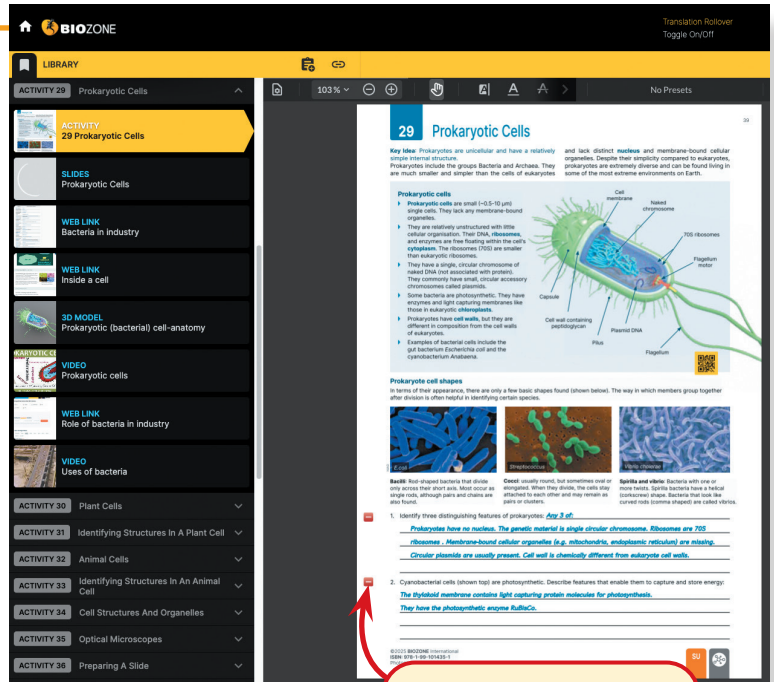

The *QCE Biology* worktext is supported by the Teacher Toolkit: a suite of resources specifically developed to help teachers plan and deliver an engaging program. A brief description of the tools available is provided below and on the following page.

BIOZONE WORLD

BIOZONE WORLD, our **science digital platform**, brings our digital worktexts and rich collection of digital resources together in a single location for easy use. Educators can easily plan lessons, assign work, and grade student responses using BIOZONE WORLD. Click on an activity to access the additional resources provided. These include presentation slides, interactive 3D models, and curated videos and weblinks.

- ▶ The **translation tool** within BIOZONE WORLD translates the content into over 150 languages.
- ▶ **Students' access** to BIOZONE WORLD allows them to use tools to mark-up, highlight, and bookmark content. They can also answer questions online and submit their work for review or grading. Students have access to the embedded collection of digital resources (presentation slides, 3D models, and curated videos and weblinks).
- ▶ Full **teacher access** to BIOZONE WORLD includes the features available to students plus additional teacher-only features, including:
 - Managing class and student enrolments.
 - The ability to view, grade, and give feedback on submitted student work.
 - Force hand-in feature.
 - Ability to display the content on a shared screen or projector to introduce or review an activity, or highlight areas of particular importance (e.g. an important step in a practical investigation).
 - Model answers are in place. Use the show/hide buttons to toggle answers on and off; ideal for sharing data or answers with students.

Students do not have access to model answers on BIOZONE WORLD.

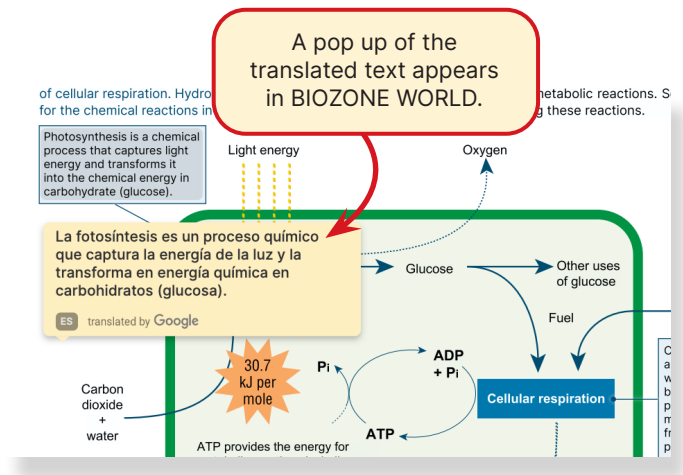

Teachers can toggle the model answers on and off for reviewing with the class.

Find out more: <https://biozone.com/au/biozone-world/>

Translation function

BIOZONE WORLD, our digital platform, provides a translation feature to support students who have English as a second language. The content can be translated into 150 languages.

Simply activate the translation feature, select the language for translation, and roll the cursor over the text to be translated. A pop up box of the translated text appears on the page. The English text is still visible. Having both languages visible supports students with their English language development while having the reassurance of their first language being accessible.

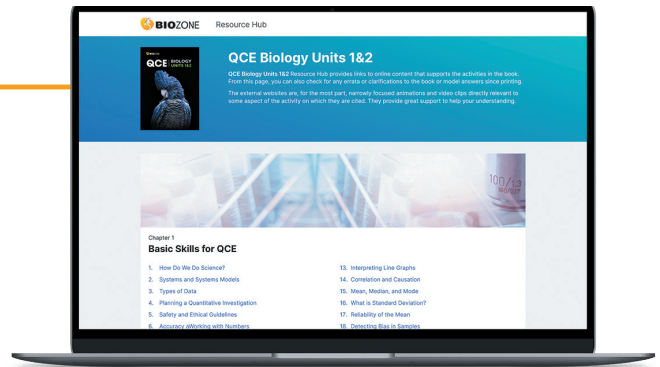

RESOURCE HUB

The **BIOZONE Resource Hub** is a free resource, available to both students and teachers. It offers a curated collection of Open Educational Resources (OER) specifically chosen to support the content of the worktext. Resources include videos, animations, games, 3D models, spreadsheets, and source material.

Content on the **BIOZONE Resource Hub** can be accessed by both print and digital users. Print users can access the material using the QR code in the worktext or bookmark the link provided (right). For BIOZONE WORLD users, these same resources are ingested into the platform and automatically appear with the selected activity.

The **BIOZONE Resource Hub** is an effective tool to engage students of all abilities within a differentiated classroom. Most resources can be used by students of all abilities. 3D models, videos, games, and simulations are great tools for engaging students in a topic, or supporting striving students in their learning journey.

Step 1: Navigate to the BIOZONE Resource Hub

www.BIOZONEhub.com

Step 2: Enter this code in the box displayed.

QCE11-2-4351

Or scan this QR code

<https://bit.ly/3zocOul>

Eukaryotic Cells

The genetic material of eukaryotic cells is found as multiple **linear chromosomes** consisting of DNA and associated proteins.

Ribosomes (80S) are larger than in prokaryotes, except those in mitochondria and chloroplasts, which are 70S.

PRESENTATION SLIDES

Presentation Slides are a very popular way for teachers to deliver a lesson in a presentation style format. Presentation Slides are a useful delivery tool in both face to face or remote teaching.

The Presentation Slides are a collection of slides specifically designed to support and enhance the content of the worktext.

The Presentation Slides are fully ingested into BIOZONE WORLD and automatically appear with the selected activity.

MODEL ANSWERS

A Model Answer booklet provides suggested answers to each of the activities, including working where appropriate (e.g. calculations).

The Contents: A Planning Tool

The contents pages are not merely a list of the activities. Encourage your students to use them as a planning tool for their program of work. Students can identify the activities they are to complete and then tick them off once completed. Ticking off the activities as they are finished gives students a sense of progression and helps them to be more personally organised in their work and time management. Teachers can see at a glance how a student is progressing through the set work. Any concerns with progress can be addressed early.

Structure of the Units and Chapters

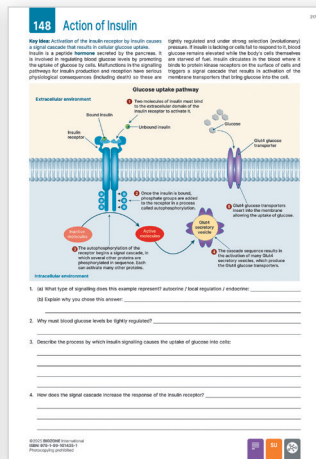

This edition of Biology for QCE Units 1 & 2 has been specifically written for the Queensland (QCE) Biology general senior syllabus (2025 version). The worktext follows the structure outlined in the syllabus. It consists of 14 content chapters and one chapter to provide support for the science and math skills for QCE Biology. The next few pages provide information about this resource and how to get the best use from it.

Structure of a Unit and Chapter

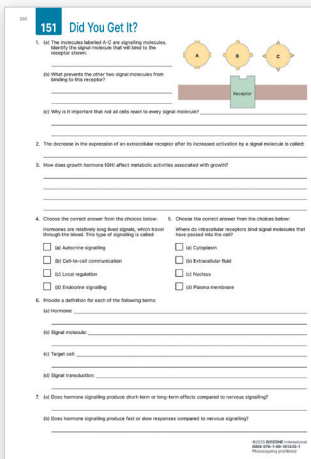

Introduction

- Provides a list of important key concepts for the chapter.
- Lists important key terms (vocab) for the chapter.
- Provides a check list of unit objectives for the chapter.
- Activities with SHE and SI components are identified.

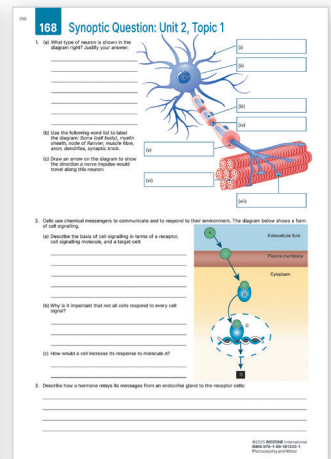

Activities

- The KEY IDEA provides the focus for the activity.
- Annotated diagrams and photographs help students understand the content.
- Answering the questions helps consolidate understanding of the content.
- Material can be used to revise for tests and exams.

Chapter test

- End-of-chapter assessment tasks test understanding of the biological terms and concepts covered within the chapter.
- Reviewing the answers can help students study for tests and exams.

Synoptic question

- Synoptic questions conclude each unit and topic of study covered in the book.
- Use them to see how well students understand the content.
- Reviewing the answers can help students study for tests and exams.

Chapter Introductions

Encourage students to interact with the chapter introductions as they work through the material as this will help them to understand key learning points for the course. The chapter introductions provide a concise list of learning outcomes that students should be able to demonstrate knowledge of by the time they complete the chapter. The chapter introduction also contains key concept and key term panels (see the example page below).

The key concepts provide a summary of the main points that students should take away from this chapter. Students can elaborate on the key concepts using the knowledge they have gained from completing the activities. The key terms draw student attention to the language they should be using when studying QCE Biology. Encourage your students to use these terms regularly in their writing and oral communications to build scientific literacy. Definitions for the key terms can be found in the glossary section of both the student and teacher edition.

As students complete each activity in a chapter, they can mark off their progress by ticking the relevant check box on the chapter introduction page.

The unit and topic are identified for easy navigation.

QR code allows quick access to helpful videos and models on BIOZONE's **Resource Hub**.

Chapter number and chapter title are identified for quick navigation.

Key terms
Important vocabulary students should understand and use during the course. Definitions are provided in the glossary at the back of the book.

Key Concepts
Cells can respond to changes in their environment by use of signalling.
Hormones are chemical signalling molecules produced in one part of the body that may bring about a change in another part of the body.

Hormones are signalling molecules

Activity Number	Description	Activity Number
1	Explain what is meant by a signal molecule (or ligand) and, in a general way, explain the effect of signal molecules on target cells. Describe how the transmission of nerve impulses at synapses, immune responses, and hormonal regulation all involve cell signalling.	143
2	Explain how a signal molecule can affect the number of cells in a tissue.	143
3	Identify types of signal molecules.	144
4	Understand what is meant by a signal molecule and how it is produced and affected by a signal molecule.	143, 145
5	Recognise that the stimulus for release of a hormone may be a substance in the blood (humoral), a nerve impulse (neuronal), or another hormone (hormonal). If you can, give an example of each.	145
6	SHE: Using an example, describe the role of negative feedback in regulating the release of hormones. Using the example of growth hormone release and regulation, explain how some hormones work antagonistically to control a homeostatic process.	149
7	SI: Explain how hormones are used in the dairy industry to increase production and reduce costs. Discuss the risks and ethical concerns with this practice.	150
Signal transduction		
8	Describe the stimulus-response model with respect to cell signalling to include reception, transduction, and cellular response.	146
9	Distinguish between signal transduction involving hydrophilic signals (e.g. adrenaline) and hydrophobic signals (e.g. steroids such as cortisol). Include reference to differences in how the signal molecule is received by receptors and how transduction is initiated.	147
10	For hydrophilic signal molecules, recognise the role of protein-coupled receptors, second messengers, and phosphorylation cascades in producing the cellular response (names of molecules not required).	147-148
11	For hydrophobic signal molecules, recognise the role of nuclear receptors (transcription factors) which are activated when the signal molecule binds to them.	147

Activity number:
The activity number for each learning outcome is identified.

Key concepts
These are the important key ideas for the chapter. Direct students to these and ensure they understand the concepts summarised here.

Component coding
Colour panels and codes identify where Science as a Human Endeavour (SHE), Science Inquiry (SI), occur in the chapter.

Learning outcomes
These provide a point by point summary of what students need to know or do by the end of the chapter.

Check boxes
Encourage students to use the check boxes to identify activities to be done (●) and to tick them off (✓) when the learning outcome is completed.

Features of the Activity Pages

The activity pages have been carefully designed to provide high quality information in an easily accessible format. They include a number of features designed to engage students and help them unpack and understand the information. Guide students through the features of the activity pages to ensure that they make the most of the material.

Key features:

- ▶ Short blocks of text so that students do not feel overwhelmed with too much reading.
- ▶ High quality, informative graphics.
- ▶ QR codes link directly to 3D models (following page). These provide fun engagement and learning moments.
- ▶ Question and answer sections allow students to demonstrate their understanding of the content. By having the stimulus material and their answers in one place, students can easily revise for assessments.
- ▶ The tab system identifies when there is support material on the **Resource Hub**. Tabs also identify the presence of specific syllabus components (see following page).

Activity number:
Identifies the activity number to help navigation between activities.

Introductory paragraph:
This provides background or introductory information to the topic.

29 Prokaryotic Cells

Key Idea:
This provides a focus for the activity and can be used as a summary take-home point of the activity.

Diagrams:
Full colour diagrams and photos help students visualise important information or concepts.

QR codes: These provide a quick link to interactive 3D models.

Activity based questions:
Students input their answers directly onto the page (print and digital products) to help reinforce the learning moment. This approach also makes revision easy because the stimulus material and answers are in one place.

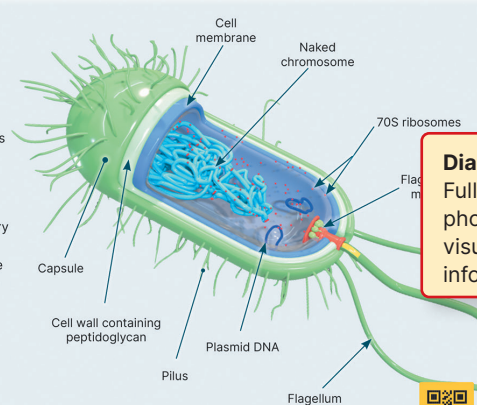

Tab system:
Page tabs identify where components of the syllabus are embedded in an activity (see next page).

The grey tab indicates there is support material available on the **BIOZONE Resource Hub** (see next page).

Key Idea: Prokaryotes are unicellular and have a relatively simple internal structure. Prokaryotes include the groups Bacteria and Archaea. They are much smaller and simpler than the cells of eukaryotes and lack distinct **nucleus** and membrane-bound cellular organelles. Despite their simplicity compared to eukaryotes, prokaryotes are extremely diverse and can be found living in some of the most extreme environments on Earth.

Prokaryotic cells

- ▶ **Prokaryotic cells** are small (~0.5-10 μm) single cells. They lack any membrane-bound organelles.
- ▶ They are relatively unstructured with little cellular organisation. Their DNA, **ribosomes**, and enzymes are free floating within the cell's **cytoplasm**. The ribosomes (70S) are smaller than eukaryotic ribosomes.
- ▶ They have a single, circular chromosome of naked DNA (not associated with protein). They commonly have small, circular accessory chromosomes called plasmids.
- ▶ Some bacteria are photosynthetic. They have enzymes and light capturing membranes like those in eukaryotic **chloroplasts**.
- ▶ Prokaryotes have **cell walls**, but they are different in composition from the cell walls of eukaryotes.
- ▶ Examples of bacterial cells include the gut bacterium *Escherichia coli* and the cyanobacterium *Anabaena*.

Prokaryote cell shapes
In terms of their appearance, there are only a few basic shapes found (shown below). The way in which members group together after division is often helpful in identifying certain species.

E. coli

Bacilli: Rod-shaped bacteria that divide only across their short axis. Most occur as single rods, although pairs and chains are also found.

Streptococcus

Cocci: usually round, but sometimes oval or elongated. When they divide, the cells stay attached to each other and may remain as pairs or clusters.

Vibrio cholerae

Spirilla and vibrio: Bacteria with one or more twists. Spirilla bacteria have a helical (corkscrew) shape. Bacteria that look like curved rods (comma shaped) are called vibrios.

1. Identify three distinguishing features of prokaryotes: _____

2. Cyanobacte _____ energy:

SU 

QR codes link to 3D models

Some activities have QR codes on the pages (circled, below). These link directly to informative and engaging 3D models. If your school does not allow students to access phones in class time, students can still access the models through the **Resource Hub** and via BIOZONE WORLD. Students can either bookmark the Resource Hub (right) or quickly access it using the bit.ly tag found on each chapter introduction.

32 Animal Cells

Key Idea: Animal cells are eukaryotic cells. They have many features in common with plant cells, but also have a number of unique features. Animal cells, unlike plant cells, do not have a regular shape. In fact, some animal cells (such as phagocytes) are able to alter their shape for various purposes (e.g. engulfing foreign material). The diagram below shows the structure and organelles of a liver cell. It contains organelles common to most relatively unspecialised human cells. Note the differences between this cell and the generalised plant cell. The plant cells activity provides further information on the organelles listed here but not described.

Generalised animal cell

Vacuoles: Smaller than those found in plant cells. In animal cells, vacuoles have minor roles in exocytosis and endocytosis.

Smooth endoplasmic reticulum: It is a site for lipid and carbohydrate metabolism, including hormone synthesis.

Nucleolus: A dense, solid structure composed of crystalline protein and nucleic acid. They are involved in ribosome synthesis.

Ribosomes: These small structures may be free in the cytoplasm or associated with the endoplasmic reticulum (ER). Ribosomes in animal cells are 80S ribosomes.

Rough endoplasmic reticulum: A site of protein synthesis. The rough ER also synthesises new membranes, growing in place by adding proteins and phospholipids.

Golgi apparatus (20-300 nm): A series of flattened, disc-shaped sacs, stacked one on top of the other and connected with the ER. The Golgi stores, modifies, and packages proteins. It tags proteins so that they go to their correct destination.

Lysosomes: A sac bounded by a single membrane. They are pinched off from the Golgi apparatus and contain various enzymes that break down food and foreign matter. Lysosomes show little internal structure but often contain fragments of material being broken down. Specialised lysosomes are generally absent from plant cells.

Nuclear pore: A hole in the nuclear membrane allowing the nucleus to communicate with the rest of the cell.

Tight junctions: Join cells together in the formation of tissues.

Nuclear membrane: Double layered.

Cytoplasm

Plasma (cell surface) membrane

Centrioles: Structures within a centrosome associated with nuclear division. They are composed of microtubules, but appear as small, featureless particles, 0.25 µm diameter, under a light microscope. They are absent in higher plant cells and some protists.

Microtubules (or microfilaments): An organelle that is made up of double helix protein strands. The number in a cell depends on its metabolic activity.

1. What is the difference between vacuoles in plant and animal cells?

2. Name one structure or organelle present in generalised animal cells but absent from plant cells and describe its function:

3. The two photomicrographs, left, show several types of animal cells. Identify the features indicated by the letters A-C:

(a) _____
 (b) _____
 (c) _____

Photomicrographs:
 Left: Nerve cells in the spinal cord (A, B, C)
 Right: White blood cells and red blood cells (A, B, C)

© 2025 BIOZONE International
 ISBN 978-1-927-19142-1
 Photocopying prohibited

Scan the QR codes on the activity pages. These link directly to 3D models. All models can be rotated and zoomed, and some contain informative annotations.

Understanding the Tab System

A simple tab system identifies where key syllabus components: Science as a Human Endeavour (SHE), Science Understandings (SU), and Science Inquiry (SI) are integrated into an activity. Unit objectives are also identified within the tab system.

Science as a human endeavour (SHE):
 This indicates an activity contains a SHE component, and promotes appreciation of the nature and development of science and its use and influence on society.

Resource Hub:
 The grey Resource Hub tab indicates there is material to support this activity on **BIOZONE's Resource Hub** (page CG6 for more information).

Syllabus objectives (left to right):
 Investigate phenomena
 Evaluate conclusions, claims, and processes
 Interpret evidence
 Analyse data
 Apply understanding
 Describe ideas and findings

Science Inquiry:
 This tab indicates an activity contains material to support the science inquiry components of the syllabus.

Science understanding:
 This tab indicates an activity covers a science understanding component.

Identifying Syllabus Components

Identifying Science as a Human Endeavour (SHE)

Chapter 15 Unit 2: Topic 2
Transmission and Spread of Disease

Key Concepts

- Many factors contribute to the transmission and spread of disease through populations. Data can be used to predict outbreaks, identify their source, infer transmission modes, and evaluate control strategy effectiveness.
- Biosecurity precautions reduce the likelihood of disease transmission between countries.

Transmission of disease

Activity Number	Page
1	194
2	195
3	197
4	194, 196

Spread of disease and epidemiology

Science as a Human Endeavour icon in the bottom right corner.

Through **Science as a Human Endeavour** contexts, students develop an appreciation about the nature and development of science, how science is used, and how it influences society. SHE components are identified in the chapter introduction and on an activity page.

Identifying Science Understanding (SU)

161 Physical Defences in Plants

Physical defences in plants

Many plants have physical defences that prevent them from infection by pathogens. These include:

- Many trees and shrubs are covered in bark. This tough, protective covering forms a physical barrier, which pathogens find difficult to cross.
- The addition of spines in the form of thorns and prickles acts as a barrier to physical damage.
- Many plants have leaves covered in a waxy cuticle. The cuticle is a waxy physical barrier, trapping pathogens away from the plant tissue on the leaf.

Science Understanding icon in the bottom right corner.

The **Science Understandings (SU)** form the framework for the delivery of content in QCE Biology. As students work through the activities, they develop deeper understanding of the key concepts, models and theories that underpin the syllabus. Orange SU tabs on an activity page identify a SU objective is covered. Science Understandings are not identified in chapter introductions.

Identifying Science Inquiry (SI)

Chapter 14 Unit 2: Topic 2
Immune Response

Key Concepts

- Vertebrates defend against pathogens through three lines of defence.
- The body has an innate and an adaptive immune response.
- Plants use physical barriers and chemical defences to protect against pathogens.

Immune Response

Science Inquiry icon in the bottom right corner.

QCE Biology provides ample opportunity for students to practise the skills necessary to work like a scientist (**Science Inquiry**). Integration of science inquiry skills helps students prepare for the Unit 3 and 4 assessments. SI components are identified in the chapter introduction and on an activity page.

Identifying Unit Objectives

157 Modelling Human Thermoregulation

Modelling Human Thermoregulation

Modelling human thermoregulation begins with a study of the human body. The model has four layers: the skin, muscle, fat, and blood. The model also shows the flow of heat between the body and the environment. The model is used to investigate the effect of the environment on the rate of heat loss.

Input	Energy balance	Condition	Heat generation	Output
Temperature	Thermoregulation	Conduction	Heat generation	Heat loss
Wind speed				
Physical activity	Thermoregulation	Conduction	Heat generation	Heat loss
Drinking				
		Conduction	Heat generation	Heat loss
		Radiation	Heat generation	Heat loss
		Respiration	Heat generation	Heat loss
		Evaporation	Heat generation	Heat loss

Unit Objectives icon in the bottom right corner.

The **Unit Objectives** for QCE Biology outline the core knowledge, skills, and capabilities students are expected to develop throughout the course. Purple tabs on an activity page identify when an objective is covered. Unit objectives are not identified in chapter introductions.

Evaluating Student Performance

While most activities require students to record a response (answer the questions provided), we do not recommend that every question is graded. In most instances, the activities have been designed so that student answers form an individual record of work, allowing students to review their answer within the context of the activity at any time.

We recommend teachers are selective about activities or questions they choose to review or grade to avoid assessment fatigue. Focus on content that students typically find challenging or on activities that cover essential material for the course. We highly recommend that end of chapter assessments and the synoptic assessment tasks are graded. Both of these provide formal opportunities to test student understanding of the content. Find out more about the formative and summative assessment tasks below, and on the following page.

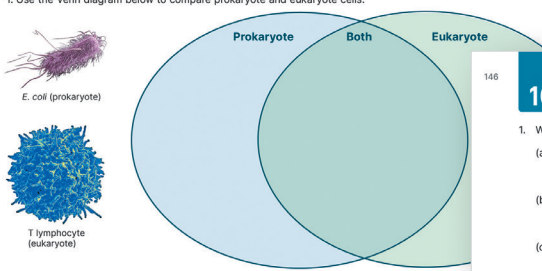

Chapter assessments: Did You Get It?

Each chapter concludes with a *Did You Get It?* assessment task. These have been designed to test student understanding of the chapter content, and can be used to help identify any gaps or misconceptions which still need to be addressed before moving on. You may wish to use the chapter assessment as a practise test before asking students to complete the summative assessment task (see more information on the next page).

58

42 Did You Get It?

1. Use the Venn diagram below to compare prokaryote and eukaryote cells:

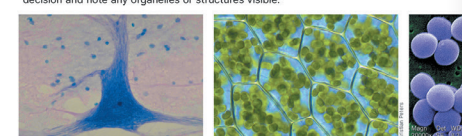

(a) Identify organelle 1: _____

(b) The organelle in (a) is found in a plant cell / animal cell / both plant and animal cells: _____

(c) Identify organelle 2: _____

(d) The organelle in (a) is found in a plant cell / animal cell / both plant and animal cells: _____

3. For each of the following images of cells, identify the cell type (plant, animal, bacterial), give a decision and note any organelles or structures visible.

(a) _____ (b) _____ (c) _____

4. Write the number at the start of the sentence on the left in front of the correct sentence ending.

1. Cells are the basic...	_____ ...such as photosynthesis
2. A cell is enclosed by a plasma membrane...	_____ ...a cell wall of cellulose
3. Plant cells have...	_____ ...do not contain membranes
4. Animal cells do...	_____ ...units of life.
5. Eukaryotic cells contain many different types of organelle...	_____ ...not have a cell wall.
6. Each organelle carries out a specific function in the cell...	_____ ...some of which are chloroplasts
7. Prokaryotic cells...	_____ ...made of a phospholipid bilayer

146

101 Did You Get It?

1. Write a definition for the terms below:

(a) Denaturation: _____

(b) Induced fit model: _____

(c) Catalyst: _____

2. A specific enzyme has an optimum temperature of 30°C. Explain what this means and what would happen if the enzyme was in temperatures above and below this:

3. Study the enzymatic word equation below and answer the following questions:

$$\text{Sucrose} + \text{Water} \xrightarrow{\text{Sucrase}} \text{Glucose} + \text{Fructose}$$

(a) Identify the substrate: _____

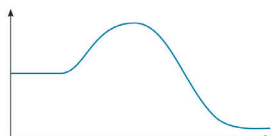

(b) Identify the products: _____

(c) Identify the enzyme: _____

4. Some heavy metals act as irreversible competitive inhibitors. Why does this make them dangerous poisons?

5. (a) Label the graph right with axes and the following labels: *Reactants*, *products*, *activation energy*, *transition state*.

(b) Assume the reaction has had no enzyme added. Draw the shape of the graph when an enzyme is added to the reaction mix.

6. The graph (right) shows the effect of an enzyme inhibitor in enzyme reaction rate.

(a) Does the graph show competitive inhibition or non-competitive inhibition?

(b) Identify the diagram below that illustrates your choice in (a): _____

7. Identify two ways organelles can increase the rate and efficiency of metabolic reactions:

©2025 BIOZONE International
ISBN: 978-1-99-101435-1
Photocopying prohibited

- Synoptic questions at the end of a unit bring together related content of the worktext. These require students to draw on the knowledge gained in a range of activities to answer the questions. Use these as formal grading moments or as preparation for a test or exam.
- The synoptic questions are written in a similar way to the questions in an exam. Students are given introductory information and asked to discuss certain aspects of the topic relating to the information. The examples used in the questions may not directly relate to examples in the workbook, but the ideas and concepts required to answer the question will have been covered in the preceding activities. This makes the synoptic questions suitable for formative assessment.
- Sometimes students will need to interpret the information given in the question’s introduction and integrate their interpretation into their answer.

102 Synoptic Question: Unit 1 Topic 2

1. Explain how the digestive system and circulatory system work together to provide nutrients to cells:

2. (a) In which region of the kidney would you find the glomeruli? _____
(b) In which region of the kidney would you find the loop of Henle? _____
(c) You would expect a desert-living mammal to have a long or short loop of Henle:

Explain your choice: _____

3. Identify the blood vessels labelled A and B on the photo (right). Give reasons for your answer:

A: _____

B: _____

4. (a) Describe how the closed circulatory system of mammals is able to deliver oxygenated blood to the cells of the body:

(b) Is the blood in the veins under high or low pressure? Explain why: _____

of pH on a peptidase (a protease) produced in the small intestine of a protein. This made the agar plate cloudy. Digestion of the protein by the

1 sized wells into which the peptidase could be added. Four different are produced and added to the wells. temperature for 4 hours.

the agar plate for best results: _____

cal reactions. Describe the induced fit model of enzyme action:

or false (F):

lower the activation energy of a reaction: _____

or binds to a site other than the active site: _____

zyme changes shape when a substrate _____

feedback loop that escalates the outcome of the loop: _____

8. In the space below draw an annotated diagram to show how a metabolic pathway can be regulated by enzymes and what happens if an enzyme does not work correctly.

Suggestions for Planning, Delivery, and Assessment

Use the features of the worktext and the BIOZONE Teacher Toolkit resources to help you streamline your course preparation and delivery. Some suggestions are provided below, but there are many other ways you can use the resources for your planning, delivery, and assessment.

Lesson planning

- The structure of *QCE Biology Units 1 & 2* follows the structure specified in the **Queensland (QCE) Biology general senior syllabus** (2025 version). Teachers can be assured that all of the essential components of the syllabus are covered, ensuring easy and efficient lesson planning with no content gaps.
- Use the chapter introductions to assign students work for each lesson.
- Add interest to your lessons by utilising the FREE, curated resources on **BIOZONE's Resource Hub** in your planning. Resources for specific activities are identified on the Resource Hub, saving you time, and extending your range of tools. You can use these to prepare students for upcoming topics, or consolidate understanding after lessons.
- Use the contents pages to help with lesson planning too. A bullet next to an activity in the contents pages identifies where there is a practical investigation. Incorporate these activities into your schedules.

Teaching

- The content is organised to follow the delivery order presented in *QCE Biology General senior syllabus*. Following the order allows for development of the content ideas and knowledge as prescribed in the syllabus document.
- Have students refer to *Chapter 1: Basic Skills for QCE*, as the need arises, or before attempting an activity that addresses a specific skill (e.g. drawing a line graph). These activities can be assigned as homework, or they can be completed in class.
- Encourage peer-to-peer learning by assigning students to groups of mixed abilities when carrying out group research projects or practical investigations.
- Extend students' scientific vocabulary by encouraging them to look up unfamiliar words in the **glossary** (Appendix 2).
- Use BIOZONE WORLD to introduce an activity and give any direction required. It can be used to review answers in class or on-line quickly and efficiently. Choose when and how you reveal the answers. To promote student discussion, reveal answers only once the students have shared their ideas. Reveal all the answers if you want the students to self mark their own work.

Assessment

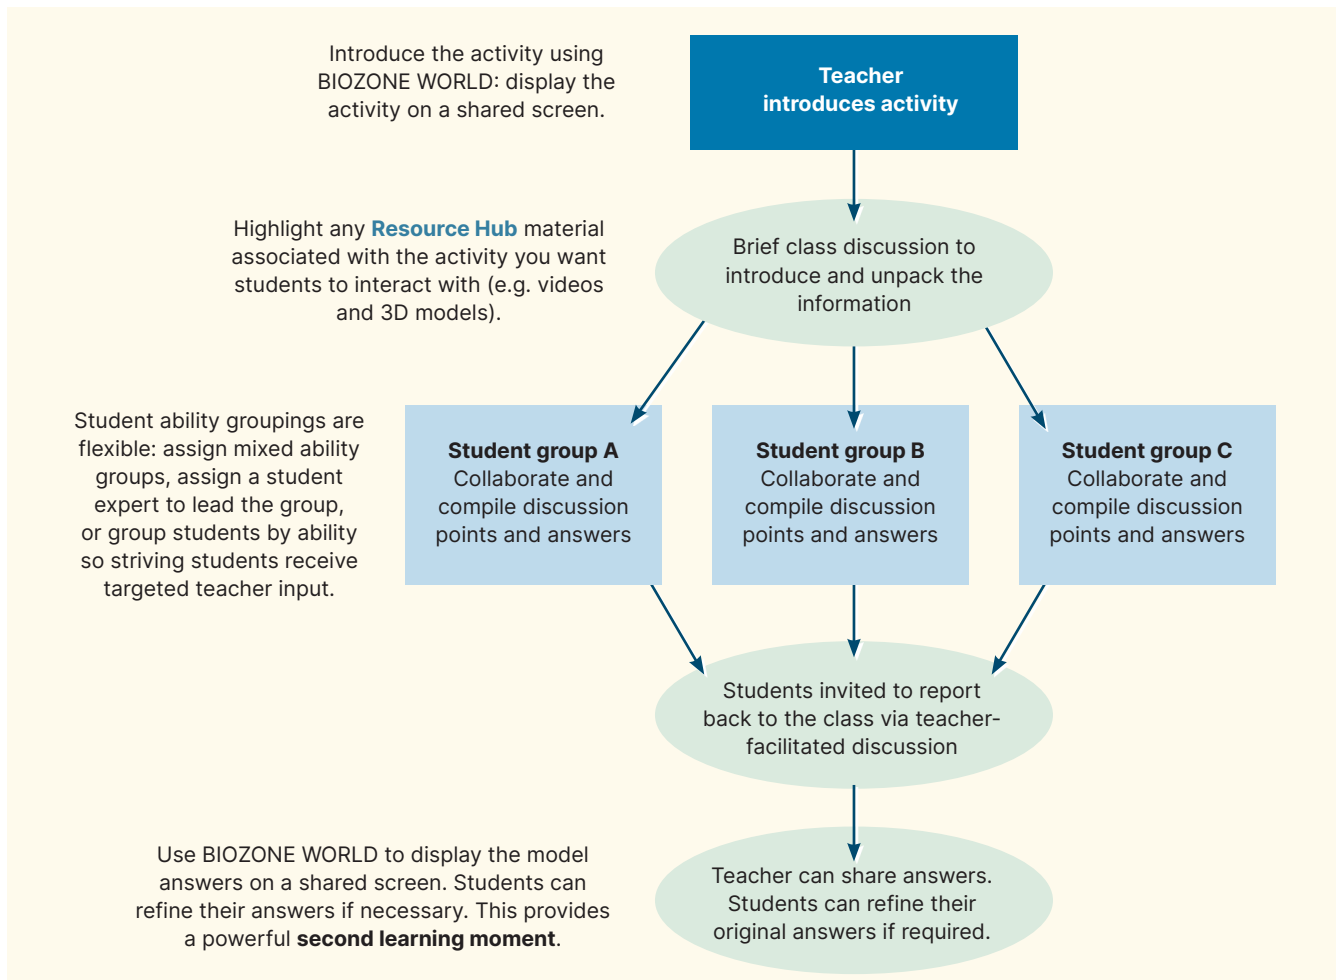

- Provide feedback (formative and summative) to students to update them on their progress. This can highlight areas of strength or areas needing work.
- Use formative assessment to identify areas the class needs to revisit before progressing to the next topic or unit. Methods of formative assessment include reviewing student answers on the Did You Get It? chapter reviews, observing students carrying out practical work, or evaluating their contribution and understanding in practical or research work.
- Use the **Synoptic Assessments** at the end of each unit to assess student understanding. This could be carried out as a test in class. Alternatively, you can set them as homework or open book assessments if you wish.

Teaching Strategies for Classroom Use

Achieving effective differential instruction in classes is a teaching challenge. Students naturally have mixed abilities, varying backgrounds in the subject, and different language skills. Used effectively, BIOZONE's worktexts and supporting resources can make teaching a mixed ability class easier. Here, we suggest some approaches for delivering content.

Making a start

Regardless of which activity you might be attempting in class, a short introduction to the task by the teacher is a useful orientation for all students. For collaborative work, the teacher can then divide the class into appropriate groups, with ability levels chosen at your discretion. Depending on the activity, the class may regroup at the end of the lesson for discussion or to present their findings, and you may choose to share model answers with the class for marking purposes.

The teacher introduces the topic. They provide structure to the session by providing background information and setting up discussion points and clear objectives. Collaboration is emphasised to encourage participation from the entire group. If necessary, students in a group can be assigned specific tasks.

Students work in small groups so that everyone's contribution is heard. They collaborate, share ideas, and engage in discourse. The emphasis is on sharing ideas, discussing questions, and formulating answers. Students may even come up with additional questions and discussion points.

Students report back on their findings. Each student should have enough knowledge to report back on the group's findings. Reporting consists primarily of providing answers to questions, but may involve presenting a report, model, or slide show, or contributing to a debate. Students can revise their original answers, providing a powerful second learning moment.

Using collaboration to maximise learning outcomes

- The structure of *QCE Biology* allows for a flexible approach to unpacking the content with your students.
- The content can be delivered in a way to support collaboration, where students work in small groups to share ideas and information to answer and gain a better understanding of a topic, or design a solution to a problem.
- By working together to ask questions and evaluate each other's ideas, students maximise their own and each other's learning opportunities. They are exposed to ideas and perspectives they may not have come up with on their own.
- Collaboration, listening to others, and voicing their own ideas is valuable for supporting English language learners to become confident in using English. It also builds and develops English and scientific vocabularies in all students.
- Use a short, informal, collaborative learning session to encourage students to exchange ideas about the answer to a question.
- A collaboration icon (right) indicates where there is an opportunity for students to work together.

Peer to peer collaboration and support

- Peer-to-peer learning is emphasised throughout the worktext, and is particularly valuable for more challenging activities in which the content is more complex or the questions require students to draw on several areas of their knowledge to solve a problem.
- Stronger students can assist their peers and, in doing so, both groups benefit from verbalising their ideas. Students for whom English is an additional language can ask their classmates to explain unfamiliar terms or ideas, and this benefits the understanding of both parties.
- Students are encouraged to think about, and share, what they already know and then build on this knowledge by exploring and explaining new content. For example, have pair, think, share activities or assign groups to work together to complete an activity, to research questions, or design a solution to a problem.

Student A is capable. He helps to lead the discussion and records the discussion in a structured way.

Students B and C are also capable but less willing to lead discussion. They will add ideas to the discussion but need a little direction from A to do so.

Student D is less able but gains ideas and understanding from the discussion of students A, B, and C. She may add to the discussion as she gains confidence in the material being studied.

Reviewing work and providing answers

Our worktext approach encourages students to demonstrate their understanding of the content by inputting their answers on the activity page, either by writing it into the printed book or typing answers onto the digital version in BIOZONE WORLD. This approach makes it easy for students to record and share their answer and ideas with other students and their teacher. They can also review their own work or peer-review the work of others. Teachers can easily review an individual's work and see how they are progressing through the content. Model answers are provided for each activity and these can be shared with students at the teacher's discretion. Self reported grading is a powerful tool for accelerating learning and should be encouraged where possible. Students should also be encouraged to refine their answers (if needed) and deepen their level of understanding. This enhances the learning moment.

Peer feedback

Dividing students into small groups allows them to share their answers and ideas and receive immediate peer feedback. Sharing ideas and discussing alternative perspectives and solutions can broaden each student's understanding or perspective. Students may or may not come to a consensus answer through this process. Some students may wish to refine their original answer after the discussion.

Class discussion to review answers

Small groups can partake in collaborative summarising when brought together as a larger group or class. Students can share ideas and answers through structured discussion, either as a class or within larger groups. The class benefits from hearing a range of ideas, and teachers can guide the discussion to ensure efficient use of time. At the end of the discussion, the teacher may wish to share the model answer with the class.

Review answers in class via BIOZONE WORLD

The teacher view in BIOZONE WORLD has model answers which can be toggled on and off using the show/hide buttons on an activity page. View activities in BIOZONE WORLD on a shared screen and reveal the answers as required. This is ideal for:

- Providing a concise model answer after a group or class discussion.
- Self marking by students. Students can amend their answer if necessary, providing a powerful secondary learning moment.
- Providing a quick review of answers if time is short.

Southern Ocean: The Southern Ocean encircles Antarctica and is covered in ice for much of the year. Complex currents in the Southern Ocean produce rich grazing zones that support abundant plankton and complex food webs.

Arctic Ocean: The vast amounts of ice associated with the polar oceans has an important stabilizing effect on the global climate. Insulating large areas of oceans from solar radiation in the summer and preventing heat loss in winter.

Icebreaker, Arctic sea ice: Satellite observations show that the Arctic sea ice is melting earlier and more rapidly than previously reported. The loss of ice cover will dramatically reduce the surface albedo (reflectivity) in the Arctic region.

1. Explain the basis of the Earth's **thermohaline** circulation: *It is driven by the cooling and sinking of water masses in the North Atlantic. In the north, they cool and sink, flowing south into the Pacific and Indian oceans, then returning as warm surface ocean currents in the South Atlantic. Cold polar water drives deep circulation.*
2. Explain how **thermohaline** circulation could influence global climate: *Thermohaline circulation transports energy (in the form of heat) around the globe. As such, the state of the circulation has a large impact on the Earth's climate. It has an important role in supplying heat to the polar regions and so regulating the amount of sea ice in these regions. Disruption of the thermohaline circulation is one possible consequence of global warming.*

Teacher review of student work

Students using the print version of *QCE Biology* write their answers directly into the space provided on the page. Teachers can revise or grade student responses as required.

Students using the digital version of *QCE Biology* input and submit their answers via the digital platform, BIOZONE WORLD. Teachers can revise or grade activities as required.

How are Language Skills Supported?

BIOZONE has several support mechanisms in place to support the development of language skills. These include collaborative tasks to build communication and listening skills, and writing answers to provide practice in written skills. The inclusion of a glossary helps to develop the scientific literacy of all students. In the digital version of the worktext (BIOZONE WORLD), a translation function supports ELLs in their learning journey. More information on these supports is provided below.

Glossary

Key terms within an activity are highlighted in **blue bold** on their first appearance and are included in the glossary. Encourage students to use the glossary to look up unfamiliar terms and expand their scientific vocabulary. Regular opportunities are provided for students to use key terms in both writing and oral communication to reinforce their use.

30 Plant Cells

Key Idea: Plant cells are eukaryotic cells. They have features in common with animal cells, but also several unique features. **Eukaryotic cells** have a similar basic structure, although they may vary tremendously in size, shape, and function. Certain features are common to almost all eukaryotic cells, including their three main regions: a nucleus, surrounded by a **watery cytoplasm**, which is itself enclosed by the **plasma membrane**. Plant cells are enclosed in a **cell wall**, which gives them a regular, uniform appearance. The cell wall protects the cell, maintains its shape, and prevents excessive water uptake. It provides rigidity to plant structures but permits the free passage of materials into and out of the cell.

Cell wall: A semi-rigid structure outside the plasma membrane, 0.1 µm to several µm thick. It is composed mainly of cellulose. It supports the cell and limits its volume.

The vacuole: A large, central, fluid-filled space surrounded by a special membrane called the **tonoplast**.

Key Idea: Chloroplasts are one of a group of double-membraned organelles called **plastids**, which include **amoplasts** (see above).

Cell wall: A semi-rigid structure outside the plasma membrane, 0.1 µm to several µm thick. It is composed mainly of cellulose. It supports the cell and limits its volume.

Middle lamella: (seen here between adjacent cells) The first layer of the cell wall formed during cell division. It contains pectin and hemicellulose, and provides adhesion between the cells to form **plasmodesmata** (P). **Plasmodesmata** are special channels that allow communication and transport to occur between cells.

Cytoplasm: A watery solution containing dissolved substances, enzymes, and the cell organelles and structures.

Nuclear membrane: A double-layered structure.

Nucleolus: A conspicuous organelle 1 µm in diameter.

Ribosomes: These small (20 nm) structures manufacture proteins. They may be free in the cytoplasm or associated with the surface of the endoplasmic reticulum.

Gold apparatus:

Cytoplasm: A watery solution containing dissolved substances, enzymes, and the cell organelles and structures.

Appendix 2: Glossary

cell wall
The rigid outermost cell layer found in plants and certain algae, bacteria, and fungi but absent from animal cells.

cellulose
A polysaccharide consisting of a linear chain of β-D-glucopyranose units linked by β-1,4-glycosidic bonds.

chloroplast
A green organelle found in plants and algae. It is the site of photosynthesis, where light energy is converted into chemical energy in the form of glucose.

cytoplasm
The fluid-filled space within a cell, containing various organelles and molecules. It is the site of many cellular processes.

plasma membrane
A phospholipid bilayer that separates the cell from its environment. It is selectively permeable, allowing some substances to pass while blocking others.

tonoplast
The membrane surrounding a central vacuole in plant cells. It is composed of cellulose and other polysaccharides.

cell wall
The rigid outermost cell layer found in plants and certain algae, bacteria, and fungi but absent from animal cells.

cellulose
A polysaccharide consisting of a linear chain of β-D-glucopyranose units linked by β-1,4-glycosidic bonds.

chloroplast
A green organelle found in plants and algae. It is the site of photosynthesis, where light energy is converted into chemical energy in the form of glucose.

cytoplasm
The fluid-filled space within a cell, containing various organelles and molecules. It is the site of many cellular processes.

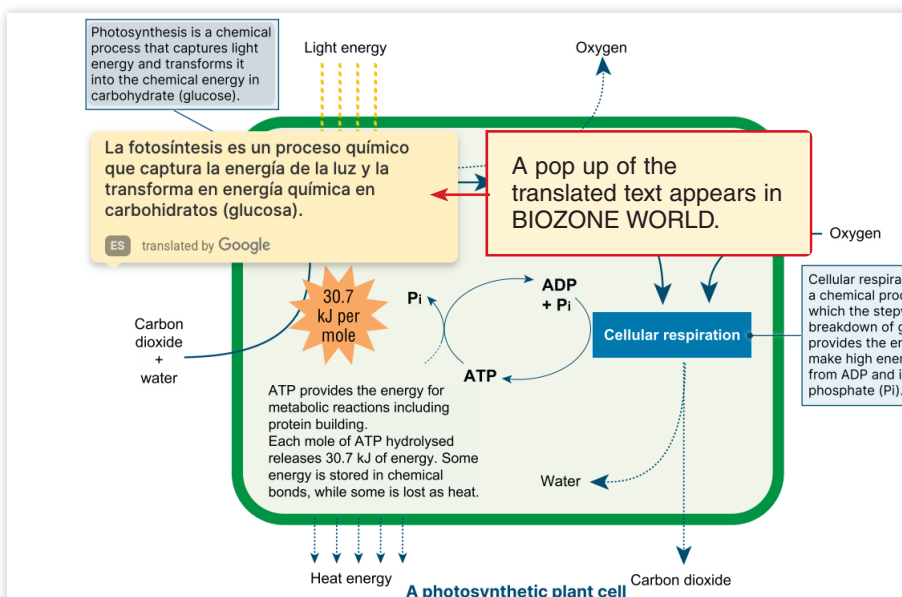

plasma membrane
A phospholipid bilayer that separates the cell from its environment. It is selectively permeable, allowing some substances to pass while blocking others.

tonoplast
The membrane surrounding a central vacuole in plant cells. It is composed of cellulose and other polysaccharides.

Translation function

BIOZONE WORLD, our digital platform, provides a translation feature to support students who do not have English as their native language. The content can be translated into ~150 languages.

Activate the translation feature, choose the desired language, and hover the cursor over the text to translate. A pop-up box with the translated text will appear, while the original English text remains visible. This dual-language view helps students develop their English language skills while providing the comfort of having their first language accessible.

How are Maths and Science Practices Supported?

A dedicated Basic Skills for QCE chapter supports students to competently use fundamental maths and science practices needed for their course. Many teachers use this chapter to provide “just in time delivery” of the skills students need to complete a particular activity. For example, students may be encountering graphing for the first time in the course. They can be directed to the Basic Skills chapter to revise the skills needed to select and draw an appropriate graph. The activities in the Basic Skills chapter can be set as homework or as a pre-activity in class so students have the skills to progress confidently through the activities.

The Need help? icon (right) alerts students and teachers that support for a skill on the activity page is provided in the Basic Skills chapter. The icon will directly reference the activity number for easy navigation.

Encourage students to use the support activities often to build their confidence and skill set.

The Need help? icon points directly to the support activity in the Basic Skills for QCE chapter.

302

4. Not all interactions will result in an infection. The pathogen may not be highly infectious or the correct mode of transmission may not have occurred (for example, a person with a cold may have been careful where and how they coughed).

5. First we need to decide the probability of each interacting person being infected. For this model we will say there is a 50% chance that any interacting person will be infected. We shall first produce a random number between 0 and 1 (see * below). We can now use this block of infected (1) or not infected (0) cells in our model. Once the formula is set up, you can recalculate the spreadsheet to produce a new set of cells.

Person	People encountered with per person	Infected person	Probability of infection	Infected person
1	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
2	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
3	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
4	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
5	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
6	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
7	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
8	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
9	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
10	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
11	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
12	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
13	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL
14	ANDREW, THERESA, AL	ANDREW, THERESA, AL	0.5	ANDREW, THERESA, AL

6. Run the model five times by recalculating the spreadsheet after ten cycles now?

7. The third model above is much more realistic than the first. List at least three factors that could be added to the model.

Modelling with S, I, and R

A more advanced predictive mathematical model than your spreadsheet called SIR can be used to show the transmission of infectious diseases. In this model there are three compartments: S (the number of susceptible individuals), I (the number of infected individuals), and R the number removed (those who have been removed through recovery or death).

The data in the table (below right) is a theoretical example. It assumes a closed system (e.g. a single state with no travel), no prior immunity (everyone is susceptible), no vaccine, and no physical distancing or other precautionary measures in place.

Week	S	I	R
0	7,000,000	2	0
1	6,999,998	15	1
2	6,999,981	119	9
3	6,999,090	847	65
4	6,993,162	6352	488
5	6,948,741	47,597	3864
6	6,618,002	354,538	27,462
7	4,271,669	2,523,602	204,731
8	0	5,533,470	1,466,532
9	0	2,766,735	4,233,267
10	0	1,383,368	5,616,634
11	0	691,684	6,308,316
12	0	345,842	6,654,160
13	0	172,921	6,827,081
14	0	86,460	6,913,542

8. Plot the tabulated SIR data left on the grid provided. Plot all three data sets on one axis with a key.

Chapter 1 Skills

Basic Skills for QCE

Key Terms: accuracy, assumption, bias, control, controlled variable, dependent variable, estimate, experiment, graph, hypothesis, independent variable, inference, investigation, measurement, model, number, observation, prediction, problem-solving, randomisation, replication, sampling, scientific method, statistical analysis, variables, accuracy, assumption, bias, control, controlled variable, dependent variable, estimate, experiment, graph, hypothesis, independent variable, inference, investigation, measurement, model, number, observation, prediction, problem-solving, randomisation, replication, sampling, scientific method, statistical analysis, variables.

Inquiry is the basis of science

Inquiry begins with observation	Activity Number
1 Describe the role of inquiry-based investigations in science. Show, through your work, your understanding of science as a non-linear process.	1
2 Use scientific models to illustrate biological processes and concepts, communicate information, make predictions, and describe systems.	2
3 Use a variety of methods to answer questions you raise as a result of observation, including field and laboratory-based investigations, simulations and models, and data analysis.	4, 5, 11
4 Understand and demonstrate safe laboratory practices and ethical guidelines in a laboratory setting.	5

12 Drawing Graphs

Key Idea: Graphs are useful for visually displaying numerical data, trends, and relationships between variables.

Graphs are an excellent way to summarise trends in data or relationships between different variables. Graphs include scatter plots and line graphs (for continuous data), and bar charts (for categorical data). For continuous data with calculated means, points can be connected. On scatter plots, a line of best fit is often drawn.

Guidelines for line graphs

WHEN TO USE: Use a line graph when both variables are continuous and one variable (the **independent variable**) affects another, the **dependent variable**. Important features include:

- The data must be continuous for both variables. The independent variable is often time or experimental treatment. The dependent variable is generally the biological response.
- The relationship between two variables can be represented as a continuum and the data points are plotted accurately and connected directly (point to point).
- Line graphs may be drawn with measure of error (right). The data are presented as points (which are calculated means), with error bars above and below, indicating the variability in the data (e.g. standard deviation).

Plotting multiple data sets

A single figure (graph) can be used to show two or more data sets, i.e. more than one curve can be plotted per set of axes. This type of presentation is useful when comparing the trends for two or more treatments, or the response of one species against the response of another. Important points regarding this format are:

- If the two data sets use the same measurement units and a similar range of values for the dependent variable, one scale on the y axis is used.
- If the two data sets use different units and/or have a very different range of values for the dependent variable, two scales for the y axis are used (see right). The scales can be adjusted if necessary to avoid overlapping plots
- The two curves are distinguished with a key.

Guidelines for scatter graphs

WHEN TO USE: Use a scatter graph to display continuous data where there are two interdependent variables.

- The data must be continuous for both variables.
- There is no independent variable, but the variables are often correlated, i.e. they vary together in a predictable way.
- Useful to determine the relationship between two variables.
- The points on the graph are not connected, but a line of best fit is often drawn through the points to show the relationship between the variables (this may be computer generated with a value assigned to the goodness of the fit).
- Obvious outliers (points that lie well outside most of the scatter) are usually disregarded from analyses.

Interpolation: For both line and scatter graphs, the fitted line can be used to find an unknown value inside the set of data points. This is called interpolation.

Graph 1: Growth rate in peas at different temperatures

Bars indicate the scatter of data either side of the mean.

Temperature (°C)	Mean growth rate (mm day ⁻¹)
10	0.4
12	0.4
14	0.45
16	0.5
18	0.6
20	0.8
22	1.2

Graph 2: Water loss and root uptake rates in peas at different relative humidity

Relative humidity (%)	Rate of water loss (cm ³ h ⁻¹)	Root uptake (cm ³ h ⁻¹)
30	10	10
40	9	10
50	8	10
60	7	10
70	6	10
80	5	10
90	4	10
100	3	10

Graph 3: Body length vs brood size in Daphnia

Line of best fit and Outlier.

Body length (mm)	Number of eggs in brood
0.5	10
0.6	12
0.7	15
0.8	18
0.9	20
1.0	22

Practical Investigations in Context

Practical investigations form an important component of the QCE Biology syllabus. Practical work provides opportunity for inquiry and investigation, and allows students to develop manipulative skills. Practicals encourage the use of 21st century skills (collaboration and teamwork, communication, critical thinking) and provide opportunities to apply skills in literacy and numeracy.

64 Investigating the Effect of Cell Size

Key Idea: Diffusion is less efficient in cells with a small surface area relative to their volume than in cells with a large surface area relative to their volume. In this activity you will design an experiment to demonstrate the effect of surface area: volume ratios on diffusion in model cells. Think about how you will plan your investigation and analyse your data to obtain meaningful results. This will help you to make valid conclusions about your findings.

Background Information

Oxygen, water, cellular waste, and many nutrients are transported into and out of cells by diffusion. However, at a certain surface area to volume ratio, diffusion becomes inefficient. In this activity you will create model cells of varying sizes from agar and see them to test the relationship between cell size and rate or efficiency of diffusion.

The diffusion of molecules into a cell can be modelled by using agar cubes infused with phenolphthalein indicator and soaked in sodium hydroxide (NaOH).

Phenolphthalein is an acid-base indicator and turns pink in the presence of a base.

As the NaOH diffuses into the agar, the phenolphthalein changes to a pink colour and this indicates how far into the agar block the NaOH has diffused (Fig. 1).

By cutting an agar block into cubes of various sizes, it is possible to investigate the effect of cell size on diffusion.

volume is smaller and diffusion is no longer an effective way to transport materials to and from the inside. In this activity you will design an experiment to demonstrate the effect of surface area: volume ratios on diffusion in model cells. Think about how you will plan your investigation and analyse your data to obtain meaningful results. This will help you to make valid conclusions about your findings.

A phenolphthalein-infused agar cube after exposure to NaOH.

Equipment list

- Glass beaker
- Paper towel
- Timer
- Agar blocks infused with phenolphthalein
- Sodium hydroxide (NaOH) solution
- Laboratory tongs
- Scalpel
- Ruler

127 Investigating Plant Transpiration

Key Idea: The relationship between the rate of transpiration and the environment can be investigated using a potometer. In this activity, you will investigate the effect of different environmental conditions on transpiration rate using a potometer. You will use the results to predict the kinds of conditions that cause the greatest water losses.

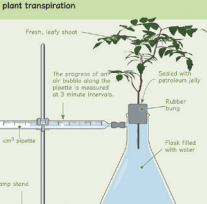

The potometer

A potometer is a simple instrument for investigating transpiration rate (water loss per unit time). The equipment is simple to use and easy to obtain. A basic potometer, such as the one shown (Fig. 1), can easily be moved around so that transpiration rate can be measured under different environmental conditions.

Some physical conditions investigated are:

- Humidity or vapour pressure (high or low)
- Temperature (high or low)
- Air movement (still or windy)
- Light level (high or low)
- Water supply

It is also possible to compare the transpiration rates of plants with different adaptations e.g. comparing transpiration rates in plants with rolled leaves vs. plants with broad leaves. If possible, experiments like those should be conducted simultaneously using replicate equipment. If conducted sequentially, care should be taken to keep the environmental conditions the same for all plants used.

A potometer attached to a data logger.

Investigation 8.1 Investigating plant transpiration

See appendix for equipment list.

- Four different conditions that influence transpiration will be tested: open conditions (ambient), which, bright light, and high humidity.
- Before starting, your teacher will decide if your groups to test one of these conditions (and which one) and pool class data for all four.
- Set up the potometer and plant as in the diagram. It is best if the plant leaves are laid out large and few (4-6 leaves). Either fresh shoot and young. Alternatively the plant can be placed in a 200 mL conical flask with 200 mL of water and a thin layer of cooking oil floated on top. This is to prevent before the experiment and then every 3 minutes (or as the experiment requires). The difference in mass in grams is equal to the volume of water transpired in mL.
- After setting up the potometer, let the apparatus equilibrate for 10 minutes, and then record the position of the air bubble in the pipette for the basis of the equipment for the alternative method. This is line 0 and position 0.
- The plant can now be exposed to one of the four conditions. Record results in Table 1.
- For the ambient environment the equipment can be placed on the bench away from bright light or wind. Record the movement of the bubble every 3 minutes for 30 minutes.
- For the high wind environment the equipment can be placed on the bench in front of a fan set on a moderate speed (low from bright light). Record the net movement of the bubble every 3 minutes for 30 minutes.
- For the bright light environment, the equipment can be placed on the bench in front of a bright light bulb.

97 Investigating Enzyme Activity

Key Idea: The factors affecting peroxidase activity can be measured using the indicator guaiacol. Enzymes control all the metabolic activities required to sustain life. Changes in environmental conditions (e.g. pH or temperature) may alter an enzyme's shape and functionality. This may result in decreased activity or complete loss of activity if the enzyme is denatured. In this activity you will use the information provided and your own understanding of enzymes to design an experiment to investigate factors affecting enzyme activity.

Background

Hydrogen peroxide (H₂O₂) is a toxic by-product of respiration and must be broken down in order to avoid cellular damage. Peroxidase acts in the presence of various organic reducing agents (electron donors) to catalyse the breakdown of H₂O₂ into water and oxidised organic substrates.

$$2\text{H}_2\text{O}_2 + 2\text{H}^+ \xrightarrow{\text{Peroxidase}} \text{H}_2\text{O} + \text{O}_2$$

Like all enzymes, the activity of peroxidase is highest within specific ranges of pH and temperature, and activity drops off or is halted altogether when the conditions fall outside of the optimal range. The conversion of H₂O₂ is also influenced by other factors such as the levels of substrate and enzyme.

The effect of environmental conditions on enzyme activity can be studied using a common reducing agent called guaiacol. Oxidation of guaiacol in the reaction above forms tetraguaiacol, which is a dark orange colour. The rate of the reaction can be followed by measuring the intensity of the orange colour as a function of time.

Increasing levels of oxygen production over time (indicated) resulting in increasing levels of orange colour over time (indicated).

A time-colour cassette is shown above. You can use it as a reference point which to compare your own results from the investigation below. The palette was produced by adding a set amount of peroxidase to a solution containing hydrogen peroxide and water. The colour change was recorded at set time points (0-6 minutes).

Investigation 3.7 Investigating peroxidase activity

See appendix for equipment list.

- Prepare six substrate tubes by 7 mL of distilled water, 0.3 mL of 0.1% H₂O₂ solution, and 0.2 mL of prepared peroxidase solution to a boiling tube. Cover the tubes with parafilm and mix.
- Prepare an enzyme tubes by adding 0.6 mL of prepared buffered pH solution (one of pH 3, 5, 6, 7, 8, and 10) and 1.5 mL of prepared kumpe peroxidase solution. Cover the tubes with parafilm and mix.
- Combine the contents of substrate and enzyme tubes and cover with parafilm. Mix and place back on the rack.
- Begin timing immediately. Record the colour change every minute (1-6 based on the colour palette above).
- You can take photos with your phones or keep a written record of the colour changes.

Colour reference number	0 min	1 min	2 min	3 min	4 min	5 min	6 min
pH 3							
pH 5							
pH 6							
pH 7							
pH 8							
pH 10							

1. The colour palette (above) shows the relative amounts of tetraguaiacol formed when guaiacol is oxidised. How can this be used to determine enzyme activity?

Some "practical" activities are not investigations in the true sense, but give students a place to develop their skills in planning and designing an experiment.

Almost all investigations require students to use a number of science skills. They encourage collaboration, problem solving and attention to detail, as well as the analysis and evaluation of data.

The practical investigations may involve setting up and carrying out an experiment (above), or could involve a paper practical or modelling activity (e.g. making a model of the plasma membrane).

Equipment lists are provided

No special kits are needed, the activities have been designed using equipment and materials commonly found in high school laboratories and classrooms. A list of equipment needed for each investigation is provided in Appendix 1. The list can be used to plan the equipment needed for the whole year or for each practical activity.

Appendix 1: Equipment List

2: Prokaryote and Eukaryote Cells

INVESTIGATION 2.1 Preparing an onion slide

Per group:

- Light microscope
- Onion/onion leaf
- Glass microscope slides
- Coverslips
- Scalpel or razor
- Iodine stain
- Filter paper/tissue paper

4: Cell Membrane

INVESTIGATION 4.1 Simple diffusion across a membrane

Per student:

- 200 mL beaker
- 1 mL pipette
- Glucose dipsticks
- Lugol's iodine
- 4 x test tubes
- Dialysis tubing
- Thread or nylon line
- Distilled water
- 1% starch solution
- 10% glucose solution
- Timer or watch

INVESTIGATION 4.2 Estimating osmolarity

Per student:

- 6 x 100 mL beakers
- Balance and equipment to weigh sugar
- Testes sugar or lab sucrose
- Potato
- Cork borer or scalpel
- Paper towels
- Marker pen

6: Exchange of Nutrients and Wastes

INVESTIGATION 5.1 Investigating amylase activity

Per student:

- Buffer solutions at pH 4, 5, 6, 7, 8
- 0.1 mol/L iodine solution (2%)
- 1% amylase solution
- 1% starch solution

Per pair/group/pip:

- Timer
- 1 mL pipette
- 2 mL pipette
- Clean syringe
- Test tube
- Spotting plate

7: Respiration and Mammalian Gas Exchange

INVESTIGATION 7.1 Measuring respiration in germinating seeds

Per group:

- 3 x boiling tubes
- Marker pen
- 6 x cotton balls
- 15% KOH solution
- 2 x eye dropper or plastic pipette
- 3 x glass pieces
- Germinated bean seeds (enough to fill one quarter of the boiling tube)
- Ungerminated bean seeds (enough to fill one quarter of the boiling tube)
- Glass beads (enough to fill one quarter of the boiling tube)
- 3 x 2-hole tube stoppers
- 3 x bent glass tubes or pipettes
- 3 x tubes (must be able to be clamped shut)
- 3 x screw clips
- A few drops of colored liquid
- 3 x syringes (must fit tube with screw clamp attached)
- 3 x clamp stands or rack
- Water bath (25°C)
- Ruler
- Timer

INVESTIGATION 7.2 Investigating yeast fermentation

Per group:

- 1 x 100 mL beaker
- 10 g of active yeast
- 50 mL tap water at 24°C
- 25 g of substrate (glucose, maltose, sucrose, or lactose)
- 1 x glass string rod
- 1 x conical flask to hold 275 mL
- Parafilm oil
- Single hole stopper
- Tubing
- 1 x 100 mL measuring cylinder
- 1 x small basin to hold inverted cylinder
- Stopwatch

8: Plant Gas Exchange and Transport Systems

INVESTIGATION 8.1 Investigating plant transpiration

Per group:

- Per pair/group
- 250 mL conical flask with rubber bung
- Potometer setup
- 1 cm³ pipette
- Clamp stand
- Leafy shoot
- Water
- Cooking oil (for optional set up)
- Timer or watch
- Lamp, or plastic bag and water spray bottle, or fan

12: Osmoregulation

INVESTIGATION 12.1 Comparing stomatal density

Per group:

- Per pair/group
- Variety of leaf types
- Clear nail varnish
- Microscope slide
- Light microscope (with eyepiece micrometer if available)

15: Transmission and Spread of Disease

INVESTIGATION 15.1 Investigating the effectiveness of handwashing

Per group:

- Per class
- Warm water
- Soap
- Hand sanitizer
- Per individual
- 1 x nutrient agar plates
- Marker pen
- Paper towel
- Incubator (if using)

INVESTIGATION 15.2 Modelling disease outbreak and spread

Per group:

- Per class
- Computer
- Spreadsheet application (e.g. Excel)
